New Features

Save and recall Zoom Locations

There are many scenarios where a user is required to revisit a particular location and zoom level. The upper left hand corner in order to begin a systematic panning around the board, a particular DFM error location, or perhaps a specific image in a panel; all are examples where this function can save time. There are six available zoom levels that can be saved. Storing a zoom level is as simple as using the hotkey combination ALT+1 through ALT-6 or through a new right-click menu. Zoom recall functions are available under "Jump To/Saved Zoom/Zoom 1 - Zoom 6" menu items, and are accessible through hotkey combinations CTRL-1 through CTRL-6.

Both the zoom level and location are saved and recalled. Note that the number pad cannot be used to access the hotkeys; the user must use 1,2,3,4,5,and 6 on the regular keyboard.

Set layer colors

In order to allow customers to pre-define specific physical layers with specific color, we have added a "View/Modify Default Layer Color Assignments" button to the "Import" section of the Tools/Customize/Settings dialog. When pushed, invokes a dialog that allows the user to select colors to be assigned to physical, hole/rout, and unassigned layers 1-15 as they are populated by file import processes.

User selections are saved to the workstation's registry so that they will remain in effect from one GWK to another.

Review DFM errors

If DFM results are stored within a GWK file, GC-Prevue can now provide a method of reviewing each result in a graphical manner. The same Review DFM functions are now available to anyone via GC-Prevue. Now customers can see the same results as the CAM engineer, making communication easier and problem resolution more accurate.

Enhanced Features

On Line Help

GraphiCode is in the process of putting all help information onto our website to allow faster and more accurate updating, easier access and reduced product size. Function information is available to all users but additional information is only available to customers with a valid Annual Support Plan. There will be a period of overlap where the Help files are still shipped with the product but all future Help information will be placed on the website.

Items Fixed since v15.3.2

This list is customer reported issues fixed for this release.

#4096 The application no longer require the Sentinel Protection Server service to be running in order to verify the license file. This was causing some issues when GraphiCode applications were being run on machines that had other software installed afterwards that deactivated this service.

#4080 Cleaned up some internal code that is currently not being utilized but caused a larger than necessary application file.

#4064 Cannot save backup Copy to directory and file of the same name. Fixed.

#4021 Reload function now properly recognizes which layers to unload in all cases.

#3977 Updated the installer to use Sentinel 7.3.2 Merge Modules for 64 bit compatibility.

#3968 Add ability to pre-assign layer colors to Physical Layers (see above).

#3930 Modified import code so that relevant data layer information such as layer name is NOT removed or overwritten on reload.

#3553 Save Zoom levels and locations (see above).
