Table of Contents

NEW FEATURES..... 2

ENHANCED FEATURES..... 2

 ON LINE HELP..... 2

ITEMS FIXED SINCE V16.2.2 3

New Features

This release does not contain any new functionality, only bug fixes. However, we have been working hard on a number of new features and functions that are currently being tested. These will be available in upcoming releases and we appreciate your patience and understanding in allowing us to release a fully tested and working product.

Enhanced Features

On Line Help

GraphiCode is in the process of putting all help information onto our website to allow faster and more accurate updating, easier access and reduced product size. Function information is available to all users but additional information is only available to customers with a valid Annual Support Plan. There will be a period of overlap where the Help files are still shipped with the product but all future Help information will be placed on the website.

Items Fixed since v16.2.2

This list is customer reported issues fixed for this release.

#4210 Problem with internal assignment of attributes resulted in the pads and traces being scaled differently in this specific dataset.

#4209 Fixed an issue in the Chinese versions of GC-Prevue that resulted in 3 of the 8 demo code characters being overwritten by a button.

#4204 Fixed issue that caused crash during Reorder Polygons.

#4190 Added functionality to handle illegal self-intersecting polygons upon import of Gerber data. Any self-intersecting polygon that is detected triggers a user warning asking if the user wants to fix the illegal polygon. If the user answers Yes then the polygon is fixed. If the user answers no then the illegal polygon is retained and currently there is no function available to fix the polygon within the application.
